### 2.3.2 Definition

The ripple voltage of the outputs shall be measured at the pins of the output connector when terminated in the load impedance specified in figure1. Ripple and noise are measured at the connectors with a 0.1uF ceramic capacitor and a 10uF electrolytic capacitor to simulate system loading. Ripple shall be measured under any condition of line voltage, output load, line frequency, operation temperature.

### 2.3.3 Ripple voltage test circuit

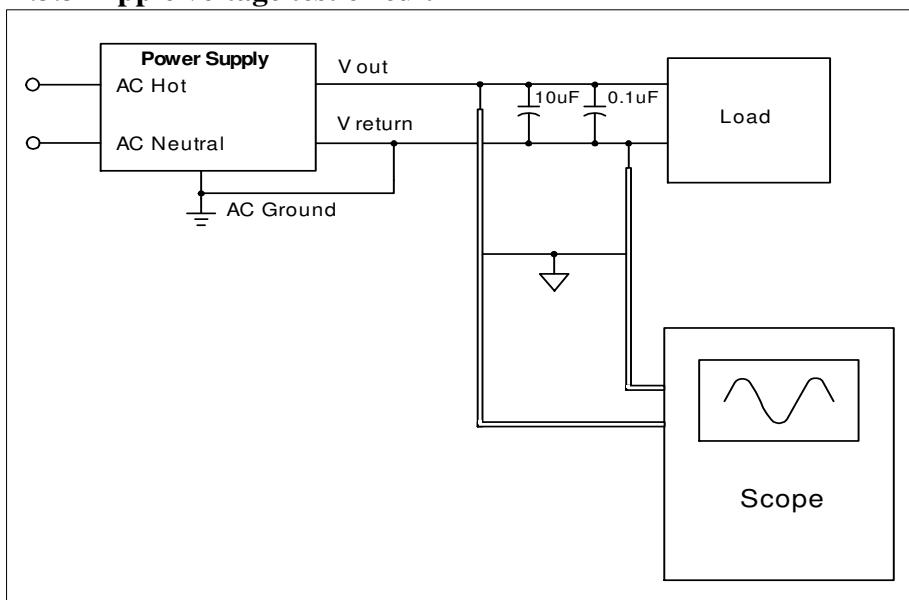

Figure 1. Ripple voltage test circuit

## 2.4 Overshoot

Any overshoot at turn on or turn off shall be less 10% of the nominal voltage value, all outputs shall be within the regulation limit of section 2.0 before issuing the power good signal of section 5.0.

## 2.5 Efficiency

Power supply efficiency typical 80% at normal AC main voltage and full load on all outputs.

## 2.6 Remote on/off control

When the logic level "PS-ON" is low, the DC outputs are to be enabled.

When the logic level is high or open collector, the DC outputs are to be disabled.

## 3.0 PROTECTION

### 3.1 Over-power protection

The power supply will be shutdown and latch off when output power over 110% ~ 150% of rated DC output.

### 3.2 Over voltage protection

The over voltage sense circuitry and reference shall reside in packages that are separate and distinct from the regulator control circuitry and reference. No single point fault shall be able to cause a sustained over voltage condition on any or all outputs. The supply shall provide latch-mode over voltage protection as defined in Table.

output	Minimum	Nominal	Maximum	Unit
+12 VDC	13.4	15.0	15.6	Volts
+5 VDC	5.74	6.3	7.0	Volts
+3.3 VDC	3.76	4.2	4.3	Volts

### 3.3 Short circuit

An output short circuit is defined as any output impedance of less than 0.1 ohms. The power supply shall shut down and latch off for shorting the +3.3 VDC,+5 VDC,or+12 VDC rails to return or any other rail. Shorts between main output rails and +5VSB shall not cause any damage to the power supply. The power supply shall either shut down and latch off or fold back for shorting the negative rails.+5VSB must be capable of being shorted indefinitely, but when the short is removed,the power supply shall recover automatically or by cycling PS\_ON#.The power supply shall be capable of withstanding a continuous short-circuit to the output without damage or overstress to the unit

### 3.4 No load operation

No damage or hazardous condition should occur with all the DC output connectors disconnected from the load. The power supply may latch into the shutdown state.

## 4.0 TIMING

### 4.1 Signal timing drawing

Figure 2 is a reference for signal timing for main power connector signals and rails.

+12 V2DC	40%	
+5 VDC	30%	
+3.3 VDC	30%

+5 VSB		0.5A

<sup>(1)</sup> For example, for a rated +5 VDC output of 18A, the transient step would be 30% x 18A=5.4A  
Output voltages should remain within the limits of Section 2.1, and the power supply should remain stable when subjected to load transients per Table 13. from any steady state load, including any or all of the following conditions:
